

OpenCore

Reference Manual (0.6.90.7.0)

[2021.05.20]

• Enabling XCPM support for an unsupported CPU variant.

Note 1: It may also be the case that the CPU model is supported but there is no power management supported (e.g. virtual machines). In this case, MinKernel and MaxKernel can be set to restrict CPU virtualisation and dummy power management patches to the particular macOS kernel version.

Note 2: Only the value of EAX, which represents the full CPUID, typically needs to be accounted for and remaining bytes should be left as zeroes. The byte order is Little Endian. For example, C3 06 03 00 stands for CPUID 0x0306C3 (Haswell).

Note 3: For XCPM support it is recommended to use the following combinations.

• Haswell-E (0x0306F2) to Haswell (0x0306C3):

• Broadwell-E (0x0406F1) to Broadwell (0x0306D4):

• Rocket Lake (0x0A0670) to Comet Lake (0x0906EB):

• Comet Lake U62 (0x0A0660) to Comet Lake U42 (0x0806EC):

Note 4: Be aware that the following configurations are unsupported by XCPM (at least out of the box):

- Consumer Ivy Bridge (0x0306A9) as Apple disabled XCPM for Ivy Bridge and recommends legacy power management for these CPUs. _xcpm_bootstrap should manually be patched to enforce XCPM on these CPUs instead of this option.
- Low-end CPUs (e.g. Haswell+ Pentium) as they are not supported properly by macOS. Legacy workarounds for older models can be found in the Special NOTES section of acidanthera/bugtracker#365.

2. Cpuid1Mask

Type: plist data, 16 bytes

Failsafe: All zero

Description: Bit mask of active bits in Cpuid1Data.

When each Cpuid1Mask bit is set to 0, the original CPU bit is used, otherwise set bits take the value of Cpuid1Data.

3. DummyPowerManagement

Type: plist boolean Failsafe: false Requirement: 10.4

Description: Disables AppleIntelCpuPowerManagement.

Note 1: This option is a preferred alternative to NullCpuPowerManagement.kext for CPUs without native power management driver in macOS.

Note 2: While this option is typically needed to disable AppleIntelCpuPowerManagement on unsupported platforms, it can also be used to disable this kext in other situations (e.g. with Cpuid1Data left blank).

4. MaxKernel

Type: plist string Failsafe: Empty

Description: Emulates CPUID and applies DummyPowerManagement on specified macOS version or older.

Note: Refer to the Add MaxKernel description for matching logic.

5. MinKernel

Type: plist string Failsafe: Empty

Description: Emulates CPUID and applies DummyPowerManagement on specified macOS version or newer.

Note: Refer to the Add MaxKernel description for matching logic.

Failsafe: false Requirement: 11

Description: Force x86 scheme for IMG4 verification.

Note: This option is required on virtual machines when using SecureBootModel different from x86legacy.

12. IncreasePciBarSize

Type: plist boolean Failsafe: false Requirement: 10.10

Description: Increases 32-bit PCI bar size in IOPCIFamily from 1 to 4 GBs.

Note: This option should be avoided whenever possible. A need for this option indicates misconfigured or defective

firmware.

13. LapicKernelPanic

Type: plist boolean Failsafe: false

Requirement: 10.6 (64-bit)

Description: Disables kernel panic on LAPIC interrupts.

14. LegacyCommpage

Type: plist boolean Failsafe: false

Requirement: 10.4 - 10.6

Description: Replaces the default 64-bit commpage boopy implementation with one that does not require SSSE3, useful for legacy platforms. This prevents a commpage no match for last panic due to no available 64-bit boopy functions that do not require SSSE3.

15. PanicNoKextDump

Type: plist boolean Failsafe: false

Requirement: 10.13 (not required for older)

Description: Prevent kernel from printing kext dump in the panic log preventing from observing panic details.

Affects 10.13 and above.

16. PowerTimeoutKernelPanic

Type: plist boolean Failsafe: false

Requirement: 10.15 (not required for older)

Description: Disables kernel panic on setPowerState timeout.

An additional security measure was added to macOS Catalina (10.15) causing kernel panic on power change timeout for Apple drivers. Sometimes it may cause issues on misconfigured hardware, notably digital audio, which sometimes fails to wake up. For debug kernels setpowerstate_panic=0 boot argument should be used, which is otherwise equivalent to this quirk.

17. ProvideCurrentCpuInfo

Type: plist boolean Failsafe: false Requirement: 10.8

Description: Provides current CPU info to the kernel.

This quirk currently provides the correct TSC and FSB values to the kernel, as well as disables CPU topology validation.

Note: These patches currently target Microsoft Hyper-V and may need to be extended for other purposes.

$18. \ {\tt SetApfsTrimTimeout}$

Type: plist integer

Failsafe: -1

Requirement: 10.14 (not required for older)

Description: Set trim timeout in microseconds for APFS filesystems on SSDs.

An entry is considered auxiliary when at least one of the following applies:

- Entry is macOS recovery.
- Entry is macOS Time Machine.
- Entry is explicitly marked as Auxiliary.
- Entry is system (e.g. Reset NVRAM).

To display all entries, the picker menu can be reloaded into "Extended Mode" by pressing the Spacebar key. Hiding auxiliary entries may increase boot performance on multi-disk systems.

4. LauncherOption

Type: plist string Failsafe: Disabled

Description: Register the launcher option in the firmware preferences for persistence.

Valid values:

- Disabled do nothing.
- Full create or update the top priority boot option in UEFI variable storage at bootloader startup.
 - For this option to work, RequestBootVarRouting is required to be enabled.
- Short create a short boot option instead of a complete one.
 - This variant is useful for some older types of firmware, typically from Insyde, that are unable to manage full device paths.
- System create no boot option but assume specified custom option is blessed.
 - This variant is useful when relying on ForceBooterSignature quirk and OpenCore launcher path management happens through bless utilities without involving OpenCore.

This option allows integration with third-party operating system installation and upgrades (which may overwrite the \EFI\BOOT\BOOT\64.efi file). The BOOT\64.efi file is no longer used for bootstrapping OpenCore if a custom option is created. The custom path used for bootstrapping can be specified by using the LauncherPath option.

Note 1: Some types of firmware may have NVRAM implementation flaws, no boot option support, or other incompatibilities. While unlikely, the use of this option may result in boot failures and should only be used exclusively on boards known to be compatible. Refer to acidanthera/bugtracker#1222 for some known issues affecting Haswell and other boards.

Note 2: While NVRAM resets executed from OpenCore would not typically erase the boot option created in Bootstrap, executing NVRAM resets prior to loading OpenCore will erase the boot option. Therefore, for significant implementation updates, such as was the case with OpenCore 0.6.4, an NVRAM reset should be executed with Bootstrap disabled, after which it can be re-enabled.

5. LauncherPath

Type: plist string Failsafe: Default

Description: Launch path for the LauncherOption property.

Default points to OpenCore.efi. User specified paths, e.g. \EFI\SomeLauncher.efi, can be used to provide custom loaders, which are supposed to load OpenCore.efi themselves.

6. PickerAttributes

Type: plist integer

Failsafe: 0

Description: Sets specific attributes for the OpenCore picker.

Different OpenCore pickers may be configured through the attribute mask containing OpenCore-reserved (BIT0~BIT15) and OEM-specific (BIT16~BIT31) values.

Current OpenCore values include:

• 0x0001 — OC_ATTR_USE_VOLUME_ICON, provides custom icons for boot entries:

For Tools, OpenCore will attempt loading a custom icon and fallback to a default icon on failure:

- ResetNVRAM Resources\Image\ResetNVRAM.icns ResetNVRAM.icns from icons directory.
- Tools\<TOOL_RELATIVE_PATH>.icns icon near the tool file with appended .icns extension.

For custom boot Entries, OpenCore will attempt loading a custom icon and fallback to the volume icon or the default icon on failure:

- <ENTRY_PATH>.icns — icon near the entry file with appended .icns extension.

For all other entries, OpenCore will attempt loading a volume icon by searching as follows, and will fallback to the default icon on failure:

- .VolumeIcon.icns file at Preboot volume in per-volume directory (/System/Volumes/Preboot/{GUID}/when mounted at the default location within macOS) for APFS (if present).
- .VolumeIcon.icns file at the Preboot volume root (/System/Volumes/Preboot/, when mounted at the default location within macOS) for APFS (otherwise).
- $-\,$. VolumeIcon.icns file at the volume root for other file systems.

Note 1: The Apple picker partially supports placing a volume icon file at the operating system's Data volume root, /System/Volumes/Data/, when mounted at the default location within macOS. This approach is flawed: the file is neither accessible to OpenCanopy nor to the Apple picker when FileVault 2, which is meant to be the default choice, is enabled. Therefore, OpenCanopy does not attempt supporting Apple's approach. A volume icon file may be placed at the root of the Preboot volume for compatibility with both OpenCanopy and the Apple picker, or use the Preboot per-volume location as above with OpenCanopy as a preferred alternative to Apple's approach.

Note 2: Be aware that using a volume icon on any drive overrides the normal OpenCore picker behaviour for that drive of selecting the appropriate icon depending on whether the drive is internal or external.

- 0x0002 0C_ATTR_USE_DISK_LABEL_FILE, provides custom rendered titles for boot entries:
 - .disk_label (.disk_label_2x) file near bootloader for all filesystems.
 - <TOOL NAME>.1bl (<TOOL NAME>.12x) file near tool for Tools.

Prerendered labels can be generated via the disklabel utility or the bless command. When disabled or missing text labels, (.contentDetails or .disk_label.contentDetails) are to be rendered instead.

- 0x0004 0C_ATTR_USE_GENERIC_LABEL_IMAGE, provides predefined label images for boot entries without custom entries. This may however give less detail for the actual boot entry.
- 0x0008 OC_ATTR_HIDE_THEMED_ICONS, prefers builtin icons for certain icon categories to match the theme style. For example, this could force displaying the builtin Time Machine icon. Requires OC ATTR USE VOLUME ICON.
- 0x0010 OC_ATTR_USE_POINTER_CONTROL, enables pointer control in the OpenCore picker when available. For example, this could make use of mouse or trackpad to control UI elements.
- 0x0020 0C_ATTR_SHOW_DEBUG_DISPLAY, enable display of additional timing and debug information, in Builtin picker in DEBUG and NOOPT builds only.
- 0x0040 0C_ATTR_USE_MINIMAL_UI, use minimal UI display, no Shutdown or Restart buttons, affects OpenCanopy and builtin picker.
- 0x0080 0C_ATTR_USE_FLAVOUR_ICON, provides flexible boot entry content description, suitable for picking the best media across different content sets:

When enabled, the entry icon in OpenCanopy and the audio assist entry sound in OpenCanopy and builtin boot picker are chosen by something called content flavour. To determine content flavour the following algorithm is used:

- For a Tool the value is read from Flavour field.
- For an automatically discovered entry it is read from the .contentFlavour file next to the bootloader, if present.
- For a custom entry it is read from the .contentFlavour file next to the bootloader if Flavour is Auto, otherwise specified via the Flavour value itself.
- If read flavour is Auto or there is no .contentFlavour, entry flavour is chosen based on the entry type (e.g. Windows automatically gets Windows flavour).

The Flavour value is a sequence of: separated names limited to 64 characters of printable 7-bit ASCII. This is designed to support up to approximately five names. Each name refers to a flavour, with the first name having the highest priority and the last name having the lowest priority. Such a structure allows describing an entry in a more specific way, with icons selected flexibly depending on support by the audio-visual pack. A missing audio or icon file means the next flavour should be tried, and if all are missing the choice happens based on the type of the entry. Example flavour values: BigSur:Apple, Windows10:Windows. OpenShell:UEFIShell:Shell.

Using flavours means that you can switch between icon sets easily, with the flavour selecting the best available icons from each set. E.g. specifying icon flavour Debian: Linux will use the icon Debian.icns if

provided, then will try Linux.icns, then will fall back to the default for an OS, which is HardDrive.icns.

Things to keep in mind:

- For security reasons Ext<Flavour>.icns and <Flavour>.icns are both supported, and only Ext<Flavour>.icns will be used if the entry is on an external drive (followed by default fallback ExtHardDrive.icns).
- Where both apply .VolumeIcon.icns takes precence over .contentFlavour.
- In order to allow icons and audio assist to work correctly for tools (e.g. for UEFI Shell), system default boot entry icons (see Docs/Flavours.md) specified in the Flavour setting for Tools or Entries will continue to apply even when flavour is disabled. Non-system icons will be ignored in this case. In addition, the flavours UEFIShell and NVRAMReset are given special processing, identifying their respective tools to apply correct audio-assist, default builtin labels, etc.
- A list of recommended flavours is provided in Docs/Flavours.md.

7. PickerAudioAssist

Type: plist boolean Failsafe: false

Description: Enable screen reader by default in the OpenCore picker.

For the macOS bootloader, screen reader preference is set in the preferences.efires archive in the isV0Enabled.int32 file and is controlled by the operating system. For OpenCore screen reader support, this option is an independent equivalent. Toggling screen reader support in both the OpenCore picker and the macOS bootloader FileVault 2 login window can also be done by using the Command + F5 key combination.

Note: The screen reader requires working audio support. Refer to the UEFI Audio Properties section for details.

8. PollAppleHotKeys

Type: plist boolean Failsafe: false

Description: Enable modifier hotkey handling in the OpenCore picker.

In addition to action hotkeys, which are partially described in the PickerMode section and are typically handled by Apple BDS, modifier keys handled by the operating system bootloader (boot.efi) also exist. These keys allow changing the behaviour of the operating system by providing different boot modes.

On certain firmware, using modifier keys may be problematic due to driver incompatibilities. To workaround this problem, this option allows registering certain hotkeys in a more permissive manner from within the OpenCore picker. Such extensions include support for tapping on key combinations before selecting the boot item, and for reliable detection of the Shift key when selecting the boot item, in order to work around the fact that hotkeys which are continuously held during boot cannot be reliably detected on many PS/2 keyboards.

This list of known modifier hotkeys includes:

- CMD+C+MINUS disable board compatibility checking.
- CMD+K boot release kernel, similar to kcsuffix=release.
- CMD+S single user mode.
- CMD+S+MINUS disable KASLR slide, requires disabled SIP.
- CMD+V verbose mode.
- Shift+Enter, Shift+Index safe mode, may be used in combination with CTRL+Enter, CTRL+Index.

9. ShowPicker

Type: plist boolean Failsafe: false

Description: Show a simple picker to allow boot entry selection.

10. TakeoffDelay

Type: plist integer, 32 bit

Failsafe: 0

Description: Delay in microseconds executed before handling the OpenCore picker startup and action hotkeys.

Introducing a delay may give extra time to hold the right action hotkey sequence to, for instance, boot into recovery mode. On some platforms, setting this option to a minimum of 5000-10000 microseconds may be required to access action hotkeys due to the nature of the keyboard driver.

 $\mathbf{Type} \colon \mathtt{plist} \ \mathtt{string}$

Failsafe: Auto

Description: Choose specific icon set to be used for boot management.

The following values are supported An icon set is a directory path relative to Resources\Image, where the icons and an optional manifest are located. It is recommended for the artists to use provide their sets in the Vendor\Set format, e.g. Acidanthera\GoldenGate.

Sample resources provided as a part of OcBinaryData repository provide the following icon set:

- AutoAcidanthera\GoldenGate Automatically select one setof icons based on the DefaultBackground colourmacOS 11 styled icon set.
- DefaultAcidanthera\Syrah Normal icon set(without prefix)macOS 10.10 styled icon set.
- OldAcidanthera\Chardonnay Vintage icon set(Old filename prefix). macOS 10.4 styled icon set.

For convenience purposes there also are predefined aliases:

- Modern Auto Nouveau icon set (Automatically select one set of icons based on the Modern Default Background filename prefix) colour: Acidanthera Golden Gate for Syrah Black and Acidanthera Chardonnay for Light Gray.
- Other value Default Custom icon set if supported by installed resources Acidanthera \Golden Gate.

8.4 Debug Properties

1. AppleDebug

Type: plist boolean Failsafe: false

Description: Enable writing the boot.efi debug log to the OpenCore log.

Note: This option only applies to 10.15.4 and newer.

2. ApplePanic

Type: plist boolean Failsafe: false

Description: Save macOS kernel panic output to the OpenCore root partition.

The file is saved as panic-YYYY-MM-DD-HHMMSS.txt. It is strongly recommended to set the keepsyms=1 boot argument to see debug symbols in the panic log. In cases where it is not present, the kpdescribe.sh utility (bundled with OpenCore) may be used to partially recover the stacktrace.

Development and debug kernels produce more useful kernel panic logs. Consider downloading and installing the KernelDebugKit from developer.apple.com when debugging a problem. To activate a development kernel, the boot argument kcsuffix=development should be added. Use the uname -a command to ensure that the current loaded kernel is a development (or a debug) kernel.

In cases where the OpenCore kernel panic saving mechanism is not used, kernel panic logs may still be found in the /Library/Logs/DiagnosticReports directory.

Starting with macOS Catalina, kernel panics are stored in JSON format and thus need to be preprocessed before passing to kpdescribe.sh:

```
cat Kernel.panic | grep macOSProcessedStackshotData |
  python -c 'import json,sys;print(json.load(sys.stdin)["macOSPanicString"])'
```

3. DisableWatchDog

Type: plist boolean Failsafe: false

Description: Some types of firmware may not succeed in booting the operating system quickly, especially in debug mode. This results in the watchdog timer aborting the process. This option turns off the watchdog timer.

4. DisplayDelay

Type: plist integer

Failsafe: 0

Description: Delay in microseconds executed after every printed line visible onscreen (i.e. console).

UEFI variable log does not include some messages and has no performance data. To maintain system integrity, the log size is limited to 32 kilobytes. Some types of firmware may truncate it much earlier or drop completely if they have no memory. Using the non-volatile flag will cause the log to be written to NVRAM flash after every printed line.

To obtain UEFI variable logs, use the following command in macOS:

```
nvram 4D1FDA02-38C7-4A6A-9CC6-4BCCA8B30102:boot-log |
awk '{gsub(/%0d%0a%00/,"");gsub(/%0d%0a/,"\n")}1'
```

Warning: Certain firmware appear to have defective NVRAM garbage collection. As a result, they may not be able to always free space after variable deletion. Do not enable non-volatile NVRAM logging on such devices unless specifically required.

While the OpenCore boot log already contains basic version information including build type and date, this information may also be found in the opencore-version NVRAM variable even when boot logging is disabled.

File logging will create a file named opencore-YYYY-MM-DD-HHMMSS.txt (in UTC) under the EFI volume root with log contents (the upper case letter sequence is replaced with date and time from the firmware). Please be warned that some file system drivers present in firmware are not reliable and may corrupt data when writing files through UEFI. Log writing is attempted in the safest manner and thus, is very slow. Ensure that DisableWatchDog is set to true when a slow drive is used. Try to avoid frequent use of this option when dealing with flash drives as large I/O amounts may speed up memory wear and render the flash drive unusable quicker.

When interpreting the log, note that the lines are prefixed with a tag describing the relevant location (module) of the log line allowing better attribution of the line to the functionality.

The list of currently used tags is as follows.

Drivers and tools:

- BMF OpenCanopy, bitmap font
- BS Bootstrap
- GSTT GoptStop
- HDA AudioDxe
- KKT KeyTester
- $\bullet \ \ \mathtt{MMDD} \mathrm{MmapDump}$
- OCPAVP PavpProvision
- OCRST ResetSystem
- OCUI OpenCanopy
- OC OpenCore main, also OcMainLib
- VMOPT VerifyMemOpt

Libraries:

- AAPL OcDebugLogLib, Apple EfiBoot logging
- OCABC OcAfterBootCompatLib
- OCAE OcAppleEventLib
- OCAK OcAppleKernelLib
- OCAU OcAudioLib
- OCA OcAcpiLib
- $\bullet \ \ \mathtt{OCBP} \mathbf{OcAppleBootPolicyLib}$
- $\bullet \ \ {\tt OCB} {\tt OcBootManagementLib}$
- OCLBT OcBlitLib
- OCCL OcAppleChunkListLib
- OCCPU OcCpuLib
- OCC OcConsoleLib
- OCDC OcDriverConnectionLib
- OCDH OcDataHubLib
- OCDI OcAppleDiskImageLib
- OCDM OcDeviceMiscLib
- OCFS OcFileLib

- 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14: ExtendedFirmwareFeatures
 Combined FirmwareFeatures and ExtendedFirmwareFeatures. Present on newer Macs to avoid extra parsing of SMBIOS tables.
- 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:ExtendedFirmwareFeaturesMask

 Combined FirmwareFeaturesMask and ExtendedFirmwareFeaturesMask. Present on newer Macs to avoid extra parsing of SMBIOS tables.
- 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:HW_BID

Hardware BoardProduct (e.g. Mac-35C1E88140C3E6CF). Not present on real Macs, but used to avoid extra parsing of SMBIOS tables, especially in boot.efi.

- 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:HW_MLB
 - Hardware BoardSerialNumber. Override for MLB. Present on newer Macs (2013+ at least).
- 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:HW_ROM
 - Hardware ROM. Override for ROM. Present on newer Macs (2013+ at least).
- 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:SSN
 - Serial number. Present on newer Macs (2013+ at least).
- 7C436110-AB2A-4BBB-A880-FE41995C9F82:prev-lang:kbd

ASCII string defining default keyboard layout. Format is lang-COUNTRY:keyboard, e.g. ru-RU:252 for Russian locale and ABC keyboard. Also accepts short forms: ru:252 or ru:0 (U.S. keyboard, compatible with 10.9). Full decoded keyboard list from AppleKeyboardLayouts-L.dat can be found here. Using non-latin keyboard on 10.14 will not enable ABC keyboard, unlike previous and subsequent macOS versions, and is thus not recommended in case 10.14 is needed.

- 7C436110-AB2A-4BBB-A880-FE41995C9F82:security-mode
 - ASCII string defining FireWire security mode. Legacy, can be found in IOFireWireFamily source code in IOFireWireController.cpp. It is recommended not to set this variable, which may speedup system startup. Setting to full is equivalent to not setting the variable and none disables FireWire security.
- 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:UIScale
 One-byte data defining boot.efi user interface scaling. Should be **01** for normal screens and **02** for HiDPI
- 7C436110-AB2A-4BBB-A880-FE41995C9F82:ForceDisplayRotationInEFI 32-bit integer defining display rotation. Can be 0 for no rotation or any of 90, 180, 270 for matching rotation in degrees.
- 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:DefaultBackgroundColor Four-byte BGRA data defining boot.efi user interface background colour. Standard colours include **BF BF BF 00** (Light Gray) and **00 00 00 00** (Syrah Black). Other colours may be set at user's preference.

9.5 Other Variables

The following variables may be useful for certain configurations or troubleshooting:

• 7C436110-AB2A-4BBB-A880-FE41995C9F82:boot-args

Kernel arguments, used to pass configuration to Apple kernel and drivers. There are many arguments, which may be found by looking for the use of PE_parse_boot_argn function in the kernel or driver code. Some of the known boot arguments include:

- acpi layer=0xFFFFFFF
- acpi_level=0xFFFF5F (implies ACPI_ALL_COMPONENTS)
- arch=i386 (force kernel architecture to i386, see KernelArch)
- batman=VALUE (AppleSmartBatteryManager debug mask)
- batman-nosmc=1 (disable AppleSmartBatteryManager SMC interface)
- cpus=VALUE (maximum number of CPUs used)
- debug=VALUE (debug mask)
- io=VALUE (IOKit debug mask)
- ioaccel_debug=VALUE (IOAccelerator debug mask)
- keepsyms=1 (show panic log debug symbols)
- kextlog=VALUE (kernel extension loading debug mask)
- nvram-log=1 (enables AppleEFINVRAM logs)
- nv_disable=1 (disables NVIDIA GPU acceleration)
- nvda_drv=1 (legacy way to enable NVIDIA web driver, removed in 10.12)
- $\ \mathtt{npci=0x2000} \ (\mathrm{legacy}, \ \mathrm{disables} \ \mathtt{kIOPCIConfiguratorPFM64})$

11.3 Tools and Applications

Standalone tools may help to debug firmware and hardware. Some of the known tools are listed below. While some tools can be launched from within OpenCore (Refer to the Tools subsection for more details), most should be run separately either directly or from Shell.

To boot into OpenShell or any other tool directly save OpenShell.efi under the name of EFI\BOOT\BOOTX64.EFI on a FAT32 partition. It is typically unimportant whether the partition scheme is GPT or MBR.

While the previous approach works both on Macs and other computers, an alternative Mac-only approach to bless the tool on an HFS+ or APFS volume:

```
sudo bless --verbose --file /Volumes/VOLNAME/DIR/OpenShell.efi \
    --folder /Volumes/VOLNAME/DIR/ --setBoot
```

Listing 3: Blessing tool

- Note 1: /System/Library/CoreServices/BridgeVersion.bin should be copied to /Volumes/VOLNAME/DIR.
- Note 2: To be able to use the bless command, disabling System Integrity Protection is necessary.

hidden options on selected platforms.

Note 3: To be able to boot Secure Boot might be disabled if present.

Some of the known tools are listed below (builtin tools are marked with *):

BootKicker*	Enter Apple BootPicker menu (exclusive for Macs with compatible GPUs).
ChipTune*	Test BeepGen protocol and generate audio signals of different style and length.
CleanNvram*	Reset NVRAM alternative bundled as a standalone tool.
GopStop*	Test GraphicsOutput protocol with a simple scenario.
KeyTester*	Test keyboard input in SimpleText mode.
MemTest86	Memory testing utility.
OpenControl*	Unlock and lock back NVRAM protection for other tools to be able to get full NVRAM
	access when launching from OpenCore.
OpenShell*	OpenCore-configured UEFI Shell for compatibility with a broad range of firmware.
PavpProvision	Perform EPID provisioning (requires certificate data configuration).
ResetSystem*	Utility to perform system reset. Takes reset type as an argument: coldreset, firmware,
	shutdown, warmreset. Defaults to coldreset.
RtcRw*	Utility to read and write RTC (CMOS) memory.

11.4 OpenCanopy

ControlMsrE2*

OpenCanopy is a graphical OpenCore user interface that runs in External PickerMode and relies on OpenCorePkg OcBootManagementLib similar to the builtin text interface.

Check CFG Lock (MSR 0xE2 write protection) consistency across all cores and change such

OpenCanopy requires graphical resources located in Resources directory to run. Sample resources (fonts and images) can be found in OcBinaryData repository. Customised icons can be found over the internet (e.g. here or there).

OpenCanopy provides full support for PickerAttributes and offers a configurable builtin icon set. The default-chosen icon set depends may depend on the DefaultBackgroundColor variable value. For Light Gray Refer to Oldicon set will be used, for other colours -- the one without a prefixPickerVariant for more details.

Predefined icons are saved in the PickerVariant-derived subdirectory of the \EFI\OC\Resources\Image directory. A full list of supported icons (in .icns format) is provided below. When optional icons are missing, the closest available icon will be used. External entries will use Ext-prefixed icon if available (e.g. OldExtHardDrive.icns).

Note: In the following all dimensions are normative for the 1x scaling level and shall be scaled accordingly for other levels.

- Cursor Mouse cursor (mandatory, up to 144x144).
- Selected Selected item (mandatory, 144x144).
- Selector Selecting item (mandatory, up to 144x40).
- Left Scrolling left (mandatory, 40x40).
- Right Scrolling right (mandatory, 40x40).

The use of System protocols is more complicated. Typically, the preferred setting is SystemGraphics or SystemText. Enabling ProvideConsoleGop, setting Resolution to Max, enabling ReplaceTabWithSpace is useful on almost all platforms. SanitiseClearScreen, IgnoreTextInGraphics, and ClearScreenOnModeSwitch are more specific, and their use depends on the firmware.

Note: Some Macs, such as the MacPro5,1, may have incompatible console output when using modern GPUs, and thus only BuiltinGraphics may work for them in such cases. NVIDIA GPUs may require additional firmware upgrades.

2. ConsoleMode

Type: plist string

Failsafe: Empty (Maintain current console mode)

Description: Sets console output mode as specified with the WxH (e.g. 80x24) formatted string.

Set to Max to attempt using the largest available console mode. This option is currently ignored as the Builtin text renderer only supports one console mode.

Note: This field is best left empty on most types of firmware.

3. Resolution

Type: plist string

Failsafe: Empty (Maintain current screen resolution)

Description: Sets console output screen resolution.

- Set to WxH@Bpp (e.g. 1920x1080@32) or WxH (e.g. 1920x1080) formatted string to request custom resolution from GOP if available.
- Set to Max to attempt using the largest available screen resolution.

On HiDPI screens APPLE_VENDOR_VARIABLE_GUID UIScale NVRAM variable may need to be set to 02 to enable HiDPI scaling in Builtin text renderer, FileVault 2 UEFI password interface, and boot screen logo. Refer to the Recommended Variables section for details.

Note: This will fail when console handle has no GOP protocol. When the firmware does not provide it, it can be added with ProvideConsoleGop set to true.

4. ForceResolution

Type: plist boolean

Failsafe: false

Description: Forces Resolution to be set in cases where the desired resolution is not available by default, such as on legacy Intel GMA and first generation Intel HD Graphics (Ironlake/Arrandale). Setting Resolution to Max will try to pull the largest available resolution from the connected display's EDID.

Note: This option depends on the OC_FORCE_RESOLUTION_PROTOCOL protocol being present. This protocol is currently only supported by OpenDuetPkg. The OpenDuetPkg implementation currently only supports Intel iGPUs.

5. ClearScreenOnModeSwitch

Type: plist boolean

Failsafe: false

Description: Some types of firmware only clear part of the screen when switching from graphics to text mode, leaving a fragment of previously drawn images visible. This option fills the entire graphics screen with black colour before switching to text mode.

Note: This option only applies to System renderer.

6. DirectGopRendering

Type: plist boolean

Failsafe: false

Description: Use builtin graphics output protocol renderer for console.

On certain firmware, such as on the MacPro5,1, this may provide better performance or fix rendering issues. However, this option is not recommended unless there is an obvious benefit as it may result in issues such as slower scrolling.

This renderer fully supports AppleEg2Info protocol and will provide screen rotation for all EFI applications. In order to provide seamless rotation compatibility with EfiBoot, builtin AppleFramebufferInfo should also be used, i.e. it may need to be overridden on Mac EFI.

7. GopPassThrough

Type: plist boolean

Failsafe: false

Description: Provide GOP protocol instances on top of UGA protocol instances.

This option provides the GOP protocol via a UGA-based proxy for firmware that do not implement the protocol.

Note: This option requires ProvideConsoleGop to be enabled.

8. IgnoreTextInGraphics

Type: plist boolean

Failsafe: false

Description: Some types of firmware output text onscreen in both graphics and text mode. This is typically unexpected as random text may appear over graphical images and cause UI corruption. Setting this option to true will discard all text output when console control is in a different mode from Text.

Note: This option only applies to the System renderer.

9. ReplaceTabWithSpace

Type: plist boolean

Failsafe: false

Description: Some types of firmware do not print tab characters or everything that follows them, causing difficulties in using the UEFI Shell's builtin text editor to edit property lists and other documents. This option makes the console output spaces instead of tabs.

Note: This option only applies to System renderer.

10. ProvideConsoleGop

Type: plist boolean

Failsafe: false

Description: Ensure GOP (Graphics Output Protocol) on console handle.

macOS bootloader requires GOP or UGA (for 10.4 EfiBoot) to be present on console handle, yet the exact location of the graphics protocol is not covered by the UEFI specification. This option will ensure GOP and UGA, if present, are available on the console handle.

Note: This option will also replace incompatible implementations of GOP on the console handle, as may be the case on the MacPro5,1 when using modern GPUs.

11. ReconnectOnResChange

Type: plist boolean

Failsafe: false

Description: Reconnect console controllers after changing screen resolution.

On certain firmware, the controllers that produce the console protocols (simple text out) must be reconnected when the screen resolution is changed via GOP. Otherwise, they will not produce text based on the new resolution.

Note: On several boards this logic may result in black screen when launching OpenCore from Shell and thus it is optional. In versions prior to 0.5.2 this option was mandatory and not configurable. Please do not use this unless required.

12. SanitiseClearScreen

 $\mathbf{Type} \colon \mathtt{plist} \ \mathtt{boolean}$

Failsafe: false

Description: Some types of firmware reset screen resolutions to a failsafe value (such as 1024x768) on the attempts to clear screen contents when large display (e.g. 2K or 4K) is used. This option attempts to apply a workaround.

Note: This option only applies to the System renderer. On all known affected systems, ConsoleMode must be set to an empty string for this option to work.

13. UgaPassThrough

Type: plist boolean

Failsafe: false

Description: Provide UGA protocol instances on top of GOP protocol instances.

Some types of firmware do not implement the legacy UGA protocol but this may be required for screen output by older EFI applications such as EfiBoot from 10.4.

11.12 ProtocolOverrides Properties

1. AppleAudio

Type: plist boolean Failsafe: false

Description: Replaces Apple audio protocols with builtin versions.

Apple audio protocols allow OpenCore and the macOS bootloader to play sounds and signals for screen reading or audible error reporting. Supported protocols are beep generation and VoiceOver. The VoiceOver protocol is specific to Gibraltar machines (T2) and is not supported before macOS High Sierra (10.13). Older macOS versions use the AppleHDA protocol (which is not currently implemented) instead.

Only one set of audio protocols can be available at a time, so this setting should be enabled in order to enable audio playback in the OpenCore user interface on Mac systems implementing some of these protocols.

Note: The backend audio driver needs to be configured in UEFI Audio section for these protocols to be able to stream audio.

2. AppleBootPolicy

Type: plist boolean

Failsafe: false

Description: Replaces the Apple Boot Policy protocol with a builtin version. This may be used to ensure APFS compatibility on VMs and legacy Macs.

Note: This option is advisable on certain Macs, such as the MacPro5,1, that are APFS compatible but on which the Apple Boot Policy protocol has recovery detection issues.

3. AppleDebugLog

Type: plist boolean Failsafe: false

ransale. Taise

Description: Replaces the Apple Debug Log protocol with a builtin version.

4. AppleEg2Info

Type: plist boolean Failsafe: false

Description: Replaces the Apple EFI Graphics 2 protocol with a builtin version.

Note: This protocol allows newer EfiBoot versions (at least 10.15) to expose screen rotation to macOS. Refer to ForceDisplayRotationInEFI variable description on how to set screen rotation angle.

5. AppleFramebufferInfo

Type: plist boolean Failsafe: false

Description: Replaces the Apple Framebuffer Info protocol with a builtin version. This may be used to override framebuffer information on VMs and legacy Macs to improve compatibility with legacy EfiBoot such as the one in macOS 10.4.

Note: The current implementation of this property results in it only being active when GOP is available (it is always equivalent to false otherwise).

6. AppleImageConversion

Type: plist boolean

Failsafe: false

Description: Replaces the Apple Image Conversion protocol with a builtin version.
